

# ELECTRONIC WINDER R2

The electronic winder R2, grooved drum system, has been developed to satisfy small winding needs in terms of efficiency, productivity and quality of final product.

The R2 has 2 positions 6" traverse and for conical packages.

The speed can be adjusted continuously by inverter from 300 to 1.000 meters per minute.

Fitted in with an electronic antipattern device to prevent the formation of the cords (patterns).

An optical sensor check the yarn and stops the single position in case of absence of the yarn.

The density of the package can be regulate adjusting the pressure of the gas spring device

Mechanical stop of each position at diameter.
